

# ACCESS TO CLEAN COOKING ENERGY AND ELECTRICITY IN MADHYA PRADESH

## KEY FINDINGS

### Access to electricity

Districts surveyed  
**10**

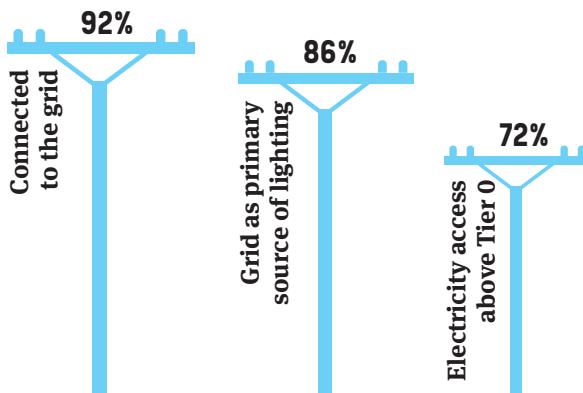

Villages  
**140**

Households  
**1,680**

- Even as only eight per cent of households in the state remained unelectrified through the grid at the time of survey, as many as 28 per cent of all households had a Tier 0-level of access to electricity, implying their inability to rely on electricity in any meaningful way.
- The proportion of households using kerosene as a primary lighting source has reduced from 27 per cent in 2015 to 13 per cent in 2018.
- A typical electrified household in Madhya Pradesh receives 18 hours of power supply in a day in 2018, which is a marked improvement from the 12 hours of supply in a day in 2015.
- In 2018, 80 per cent of electrified households receive four or more hours of electricity between sunset and midnight, up from 72 per cent in 2015.
- Over 16 per cent of grid-electrified households in the state had not received an electricity bill in the past one year or ever.
- Over 74 per cent of respondents from electrified households in 2018 noted that they were 'satisfied' with their electricity situation, in contrast to the five per cent of respondents from electrified households in 2015 who reported so.
- Not all households experienced improved access to electricity in the last three years, as more than half of Tier 2 households and three-quarters of Tier 3 households in 2015 had regressed to lower tiers in 2018.

Tier 0: lowest level of energy access | Tier 3: highest level of energy access

### Access to Clean Cooking Energy and Electricity: Survey of States (ACCESS)

The Access to Clean Cooking Energy and Electricity - Survey of States (ACCESS) is India's largest multidimensional energy access survey conducted across six of the major energy-access-deprived states - Bihar, Jharkhand, Madhya Pradesh, Odisha, Uttar Pradesh, and West Bengal. The study conducted by the Council on Energy, Environment and Water (CEEW), with support from the Shakti Sustainable Energy Foundation and the Lee Kuan Yew School of Public Policy (National University of Singapore), covered more than 9,000 households from 756 villages in 54 districts collecting about 5 million data points. The results from the first round of the study, ACCESS 2015, highlighted the need to look beyond connections to enable rural India's access to modern forms of energy. In 2018, we revisited the households to understand the changes in their energy access situation over the last three years, and to study the impact of government policies during this period. The study analyses energy access for households using a multidimensional, multi-tier framework. Households are assigned tiers on the basis of their level of access to energy. Tier 0 indicates the lowest level of access and Tier 3, the highest.

## Access to clean cooking energy

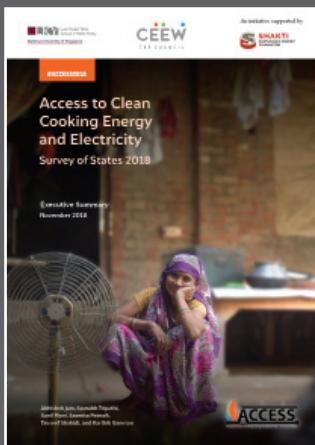

1. Figure 2 demonstrates a marked improvement not only in the overall use of LPG, but also in its use as the primary cooking fuel and exclusive cooking fuel since 2015, when just 17 per cent of rural households in the state had an LPG connection, 9 per cent used it for their primary cooking needs, and only three per cent used LPG exclusively for cooking.
  2. About three-quarters of households that received an LPG connection in the last two years, received it under the *Pradhan Mantri Ujjwala Yojana* (PMUY).
  3. The median annual number of LPG cylinders consumed by households that have had LPG for at least one year, is five cylinders. The consumption is higher for non-PMUY households (six cylinders annually) when compared with PMUY households (four cylinders annually).
  4. The proportion of rural LPG users that get LPG delivered to their doorstep remains rather low at 25 per cent, even though it has improved from 9 per cent in 2015.
  5. Households that do not get LPG delivered to their doorstep report a median one-way
- distance of eight km travelled to procure LPG. This distance travelled was 11 km in 2015.
6. About 78 per cent of households with LPG reported being ‘satisfied’ with their general LPG situation, and under 10 per cent reported being ‘unsatisfied’.
  7. Of the households that do not use LPG, about 86 per cent are interested in getting one. However, 87 per cent mentioned steep cost of getting a connection and the high monthly recurring expenses as reasons for not having LPG.
