

Annexure 1 | How is Extreme Heat Impacting India: Assessing District-level Risk

Shravan Prabhu, Keerthana AS, Srishti Mandal, Divyanshu Sharma, and Dr Vishwas Chitale | May 2025

About this annexure

Our study found that 57 per cent of Indian districts, home to 76 per cent of India's total population, are currently at high to very high heat risk. All government authorities — at the state, district, and city levels — must plan for extreme heat risk mitigation, preparedness, response, and relief. As recommended by the NDMA Guidelines, this issue is primarily addressed through HAPs in India.

This study provides actionable insights to inform heat risk—based decision-making across key sectors including:

- Water — to assess and manage water scarcity risks;
- Agriculture — to map risks to outdoor workers and crop productivity;
- Health — to understand the direct impact on public health;
- Power — to estimate cooling and electricity demand.

This study's key objective is to support agencies such as SDMAs as well as district- and city-level authorities in developing more effective, data-driven HAPs. Insights from our study can help agencies recognise key risk drivers and prioritise financial resources accordingly. To facilitate this, we have developed this state- and UT-specific handbook, which include heat risk trend analyses, maps, and data visualisations. Agencies can directly leverage these resources to inform HAP development and other policy documents.
